

- Goals
- Define integrability and integrals
 - Definite integrals and signed area and averages

Recall that for $f: [a, b] \rightarrow \mathbb{R}$ a function, a Riemann sum for f (relative to a regular partition $P = \{a = x_0 < x_1 < \dots < x_n = b\}$ and choices $x_i^* \in [x_i, x_{i+1}]$, $1 \leq i \leq n$) is

$$\sum_{i=1}^n f(x_i^*) \Delta x$$

where $\Delta x = x_i - x_{i-1} = \frac{b-a}{n}$ and is independent of choice of x_i^*

Defn If $\lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x$ exists, then we say that f is integrable (over $[a, b]$) and write

$$\int_a^b f(x) dx := \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x$$

Not all functions are integrable! E.g. $f(x) = \begin{cases} 1/x & x > 0 \\ 0 & x = 0 \end{cases}$
is not integrable over $[0, b]$ for any $b > 0$.

But $\frac{1}{\sqrt{x}}$ is integrable over $[0, b]$
despite "blowing up."

Some functions have different limits of Riemann sums
depending on choices of x_i^* !

E.g. the function $\chi_{\mathbb{Q}}: \mathbb{R} \rightarrow \mathbb{R}$ defined by $\chi_{\mathbb{Q}}(x) = \begin{cases} 0 & \text{if } x \text{ is irrational} \\ 1 & \text{if } x \text{ is rational} \end{cases}$ characteristic function of the rational numbers $\mathbb{Q}$

Over $[0, 1]$, if we take x_i^* rational all Riemann sums evaluate to 1; if all x_i^* irrational, they're all 0. 🤖

Fact If $f: [a, b] \rightarrow \mathbb{R}$ is continuous (or piecewise continuous), then f is integrable. ↪ prove in Math 112.

Terminology

$\sum \rightsquigarrow \int$ as $n \rightarrow \infty$: stylized summa

limits of integration

$f(x^*) \Delta x$
 $f(x) dx$

integrand

variable of integration

(definite) integral of f from a to b

Note $\int_a^b f(x) dx = \int_a^b f(u) du = \int_a^b f(\boxed{x}) d\boxed{x}$

E.g. Monday we saw that via right Riemann sum

$x_i^* = \frac{i}{n}$, for $f(x) = x$,

$$\sum_{i=1}^n f(x_i^*) \Delta x = \sum_{i=1}^n \frac{i}{n} \cdot \frac{1}{n} = \frac{n-1}{2n} \xrightarrow{n \rightarrow \infty} \frac{1}{2}.$$

Thus $\int_0^1 x \, dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x = \lim_{n \rightarrow \infty} \frac{n-1}{2n} = \frac{1}{2}.$

Does this make sense?

Problem Use geometry to find $\int_0^6 (x-2) \, dx$.

$$\int_0^6 (x-2) dx = \frac{1}{2} \cdot 4 \cdot 4 - \frac{1}{2} \cdot 2 \cdot 2 = 8 - 2 = 6$$

Note

$$\int_a^b f(x) dx = \left(\begin{array}{l} \text{area above } x\text{-axis} \\ \text{and below } y=f(x) \end{array} \right) - \left(\begin{array}{l} \text{area below } x\text{-axis} \\ \text{and above } y=f(x) \end{array} \right)$$

area b/w $y=f(x)$

and x -axis

$$= \int_a^b |f(x)| dx$$

Properties of $\int_a^b$:

$$\bullet \int_a^a f(x) dx = 0$$

- $\int_b^a f(x) dx = -\int_a^b f(x) dx$ [convention]

- $\int_a^b (f(x) + c g(x)) dx = \int_a^b f(x) dx + c \int_a^b g(x) dx$ [linearity]

- $\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$

Problem Suppose $\int_1^5 f(x) dx = -3$, $\int_2^5 f(x) dx = 4$. Find $\int_1^2 f(x) dx$

A

$$\int_1^5 f(x) dx = \int_1^2 f(x) dx + \int_2^5 f(x) dx$$

$$-3 = \int_1^2 f(x) dx + 4 \Rightarrow \int_1^2 f(x) dx = -3 - 4 = -7$$

Comparison Theorem If $f(x) \geq g(x)$ for all $a \leq x \leq b$, then

$$\int_a^b f(x) dx \geq \int_a^b g(x) dx.$$

Cor (1) If $f(x) \geq 0$ on $[a, b]$, then $\int_a^b f(x) dx \geq 0$.

(2) If $m \leq f(x) \leq M$ on $[a, b]$, then

$$m(b-a) \leq \int_a^b f(x) dx \leq M(b-a).$$

$$\int_a^b m dx = m \cdot (b-a) \leq \int_a^b f(x) dx \leq M \cdot (b-a) = \int_a^b M dx$$

Defn The average value of $f(x)$ on $[a, b]$ is

$$f_{\text{ave}} := \frac{1}{b-a} \int_a^b f(x) dx.$$

Note f_{ave} = (height of rectangle whose signed area = signed area b/w $y=f(x)$ and x -axis)

Problem Show f_{ave} is constant!

$$\int_a^b (f(x) - f_{\text{ave}}) dx = 0.$$

$$\underline{\underline{A}} \quad \int_a^b (f(x) - f_{\text{ave}}) dx = \int_a^b f(x) dx - \int_a^b f_{\text{ave}} dx$$

$$= \int_a^b f(x) dx - f_{\text{ave}} \int_a^b 1 dx$$

$$= \int_a^b f(x) dx - (b-a) \cdot f_{\text{ave}}$$

$$= \int_a^b f(x) dx - \int_a^b f(x) dx$$

$$= 0.$$

$$\int_a^b c dx$$

$$= c \cdot (b-a)$$
